

# Labs Overview

The purpose of these labs is to build a Retrieval Augmented Generation (RAG) system. This system can then be used to ask questions using Natural Language Queries.

## Components

The following components are used to build the application:

Azure OpenAI service	Chat and embedding models inferencing
Azure Cosmos DB for MongoDB vCore	Store products data and vector representations
Azure Cosmos DB for NoSQL	Store user conversation history
Streamlit + Python	Chatbot front-end

## Lab 1 - Azure Cosmos DB for MongoDB vCore

Purpose of the lab:

- Connect to an existing Azure Cosmos DB for MongoDB vCore account
- Create a database (one per team)
- Create a products collection (one per team)
- Create a vector index on the products collection

## Lab 2 - Azure Cosmos DB for NoSQL

Purpose of the lab:

- Connect to an existing Azure Cosmos DB for NoSQL account
- Create a database (one per team)
- Create a conversations container (one per team)

## Lab 3 – Data ingestion into Azure Cosmos DB for MongoDB vCore

Purpose of the lab:

- Deploy Azure AI models for chat and embeddings
- Prepare a Python virtual environment
- Ingest json files (product.json + customer.json) into Azure Cosmos DB for MongoDB vCore, using a Python notebook in Visual Studio Code
- Verify that data was properly ingested

## Lab 4 – Create a web app using Azure AI Studio

Purpose of the lab:

- Use Azure AI Studio to deploy a web app that allows a user to query its own data
- Configure of Azure AI Studio to add your own data source
- (Optional) add voice recognition to the Azure AI Studio
- Deploy a web app front-end application

## Lab 5 – Create a Python chatbot

Purpose of the lab:

- Create a Python chatbot (Streamlit application with Langchain) to query the Azure Cosmos DB for MongoDB vCore products collection, using natural language
- Store user conversations in an Azure Cosmos DB for NoSQL container

## Lab 6 – Hybrid search with Azure AI Search

Purpose of the lab:

- Modify the Streamlit front-end application to support hybrid search over Azure AI Search, instead of vector search on Azure Cosmos DB for MongoDB vCore

## Lab 7 – Get statistics on the Open AI Usage

Purpose of the lab:

- Create a report with powerBI desktop who will analyze the usage of your application develop in previous LAB
